

QUARTERLY TECHNICAL REPORT 82-B

on

Earthquake Monitoring of Eastern Washington and Northern Oregon

April 1 through June 30, 1982

Geophysics Program

University of Washington

Seattle, Washington

This report was prepared as an account of work sponsored by the United States Government. The United States government, nor any of its employees, nor any of its contractors, subcontractors, or their employees, makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness or usefulness of any information, apparatus, product or process disclosed, or represents that its use would not infringe privately-owned rights.

CONTRACT NO. C-10976**

Operations

The second quarter of 1982 was exceptionally good insofar as network operations were concerned. Difficulties caused by winter weather were mainly cleaned up by early April, and the eastern Washington stations were up 100% of the time for much of May and June. Two station sites had changes made in their instrumentation. Calibrated S13 seismometers were installed at WA2 and ETT, and a new low-noise VCO was also installed at ETT. The WA2 VCO will be replaced later this year. MDW was scheduled for a change to an S13 seismometer, but site access problems and severe summer temperatures have delayed this. Calibration curves are being prepared and will be included with the annual report.

Data

There were 117 events processed by the network in the Eastern Washington - Northern Oregon region. Of these 42 were known or suspected blasts and 75 were earthquakes. Only 5 of these were hand picked from film records because they were missed for one reason or another by the on-line computer system. This activity is slightly below normal as compared to the previous several reporting periods. Table I is the event catalog for this quarter and figures 1-4 show the epicenters for earthquakes separate from blasts in the two areas of interest.

There were no felt events nor events of significant size in the reporting area during this quarter. There were no events larger than magnitude 2.1 and no unusual sequences of events. The activity near Wooded Island mentioned in the last quarterly report did not continue, and other than typical activity near Entiat, and a small sequence of 5 events near Yakima there were no unusual concentrations of activity in Eastern Washington. More earthquakes were located to the southwest of Mount St. Helens than in previous quarters. This may be due, at least partly, to the increased sensitivity in this area because of the new stations in the Portland area.

Downhole Seismometer Program

Development of a high performance isolation amplifier-data transmission unit for the downhole seismometer was conducted during this quarter. The electrical environment near the test boreholes is very bad, and a need for high common-mode rejection amplifiers was great.

The seismic attenuation model using the modified and corrected Holosonics cross-hole survey was completed. The resulting model is an alternating sequence of high and low velocity layers of thickness ratio roughly 2:1, but sometimes up to 1:1. The model is a substantial improvement over existing ones.
