

QUARTERLY TECHNICAL REPORT 82-C**on****Earthquake Monitoring of Eastern Washington and Northern Oregon****July 1 through September 30, 1982****Geophysics Program****University of Washington****Seattle, Washington**

This report was prepared as an account of work sponsored by the United States Government. The United States government, nor any of its employees, nor any of its contractors, subcontractors, or their employees, makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness or usefulness of any information, apparatus, product or process disclosed, or represents that its use would not infringe privately-owned rights.

By acceptance of this article, the publisher and/or recipient acknowledges the U.S. Government's right to retain a non-exclusive, royalty-free license in and to any copyright covering this paper.

PREPARED FOR THE U.S. DEPARTMENT OF ENERGY
UNDER CONTRACT NO. EY-76-S-06-2225
TASK AGREEMENT NO. 39

and

THE U.S. NUCLEAR REGULATORY AGENCY
UNDER CONTRACT NO. NRC-04-81-177

Operations

There were a number of changes made in the operation of the Eastern Washington - Northern Oregon network during the reporting period. One station, EUK, was discontinued. It has been a noisy site and contributed little useful data. Two new sites were added in east-central Oregon, JBO and SBO. In western Oregon, a new station was installed at KMO. These three new stations have improved station distribution for purposes of local and regional monitoring.

There have been several changes in the USGS Northern Oregon network and several of the stations will be closed. The remainder are to be integrated with the University of Washington seismic network and will be recorded only at the University. Planning is not complete at this time, so a map of the revised configuration is not presented here.

Most eastern Washington stations continued operation with little down time during the report period.

Data

There were 171 events processed by the network in the Eastern Washington - Northern Oregon region. Of these 61 were known or suspected blasts and 110 were earthquakes. Only 2 of these were hand picked from film records because they were missed by the on-line computer system. This activity is about normal as compared to the previous reporting periods. In southwestern Washington, a large number of blasts have occurred in the last quarter, so some blasts may still contaminate the earthquake catalog. Earthquakes may be blasts. Table I is the event catalog for this quarter and figures 1-4 show the epicenters for earthquakes separate from blasts in the two areas of interest.

There were three felt events in the report area during this quarter. A magnitude 2.3 earthquake was felt near Quincy in eastern Washington. On 18 August, a

490

magnitude 3.4 earthquake occurred northeast of Mt. Hood and was felt at Timberline Lodge. The third felt event ($M=3.4$) occurred on the east flank of the Cascades and was felt by a few people in American River. In the central Pasco Basin, two small swarms of activity are evident. One of these occurred northeast of the Saddle Mountains and the other at Berg Ranch. The Berg Ranch area has experienced many swarms in the past. There was only a half a dozen earthquakes in each swarm with a maximum magnitude of 2.6. Twenty-four earthquakes were located in Northern Oregon; this level of activity is similar to that seen in the previous quarter.

Downhole Seismometer Program

Parts were ordered for the downhole seismometer. Design of downhole amplifier system was completed. Surface signal isolation amplifier package was also designed and parts ordered. Final phase of analysis of the cross-hole seismic data was completed, and the velocity model for the Plateau finalized (figures in annual report). Modeling of the ground response to waves impinging upon the Plateau (with our new velocity model) is now being performed.
