

QUARTERLY TECHNICAL REPORT 83-C

on

Seismicity of the Washington and Northern Oregon Cascades

July 1 through September 30, 1983

Geophysics Program

University of Washington

Seattle, Washington

This report is prepared as a preliminary description of the seismic activity in the Cascade Mountains of Washington and Northern Oregon. Information contained in this report should be considered preliminary, and not cited for publication. Seismic network operations in and around the Cascade Range are supported by the following contracts:

U.S. GEOLOGICAL SURVEY
CONTRACT NO. 14-08-0001-21192
and CONTRACT NO 14-08-0001-19848

and

U.S. DEPARTMENT OF ENERGY
CONTRACT NO. EY-76-S-06-2225
TASK AGREEMENT NO. 39

and

U.S. NUCLEAR REGULATORY AGENCY
UNDER CONTRACT NO. NRC-04-81-177

Operations

Many of the Oregon Cascade and Coast Range stations were accessed in June and July, permitting us to restore reasonable monitoring in northern Oregon. Most of the J402 amplifier/VCO's in the former USGS sites had failed and have been replaced with Develco 6202's, virtually eliminating our stock of spares. While several problems still exist with the northern Oregon stations, it appears that most or all will be operational by mid-November.

In the Washington Cascades, the operational status has been better all along and was improved further during the quarter.

Data

There were 207 events in the Cascades processed by the network during the time period July 1 through September 30, 1983. Of these, 66 were known or suspected blasts, and 141 were earthquakes. Ten of the earthquakes were hand-picked from film records, because they did not trigger the online system. 35 of the earthquakes occurred in the Mt. St. Helens area. The apparent decrease in the number of Mt. St. Helens events this quarter as compared to last quarter is due to a change in the processing of earthquakes at MSH and not to a change in level of seismic activity. As of early July, events not well recorded by the online PDP 11/34 are no longer processed. Table 1 is the event catalog for this quarter. The region considered in this report is outlined. Figure 1 shows the earthquakes in the northern and southern Cascades excluding Mount St. Helens (MSH); and figure 2 shows earthquakes in the MSH area. Blasts and probable blasts are not plotted.

During the second quarter of 1983, one felt event occurred in the Cascades. A M=3.1 earthquake was felt at North Bend, on August 12, 1983 at 18:12 PDT. This was also the largest event to occur in the Cascades during the third quarter. The

clustered epicenters in the central Cascades are aftershocks of the 1981 Goat Rocks earthquake. Eight earthquakes occurred in this cluster; the largest event was a magnitude 2.1.

In the southern Cascades, the only striking cluster is a group of aftershocks of the 1981 Elk Lake earthquake ($M=5.1$). Fourteen earthquakes occurred in the aftershock zone; the largest events in this group were $M=1.3$ earthquakes.

At Mt. St. Helens, a cornucopia of low-frequency earthquakes and gas emissions reflected the continuous slow dome growth seen during the quarter. 35 earthquakes were located in the Mt. St. Helens region during the quarter. Numerous gas emissions and avalanches also occurred throughout the quarter. On September 16, deformation rates on the south side of the dome increased significantly. The increase was not associated with an increase in seismic activity. In fact, the seismic activity showed a marked decrease at this time; from 8 earthquakes per day prior to this date to 4 earthquakes per day following this date.

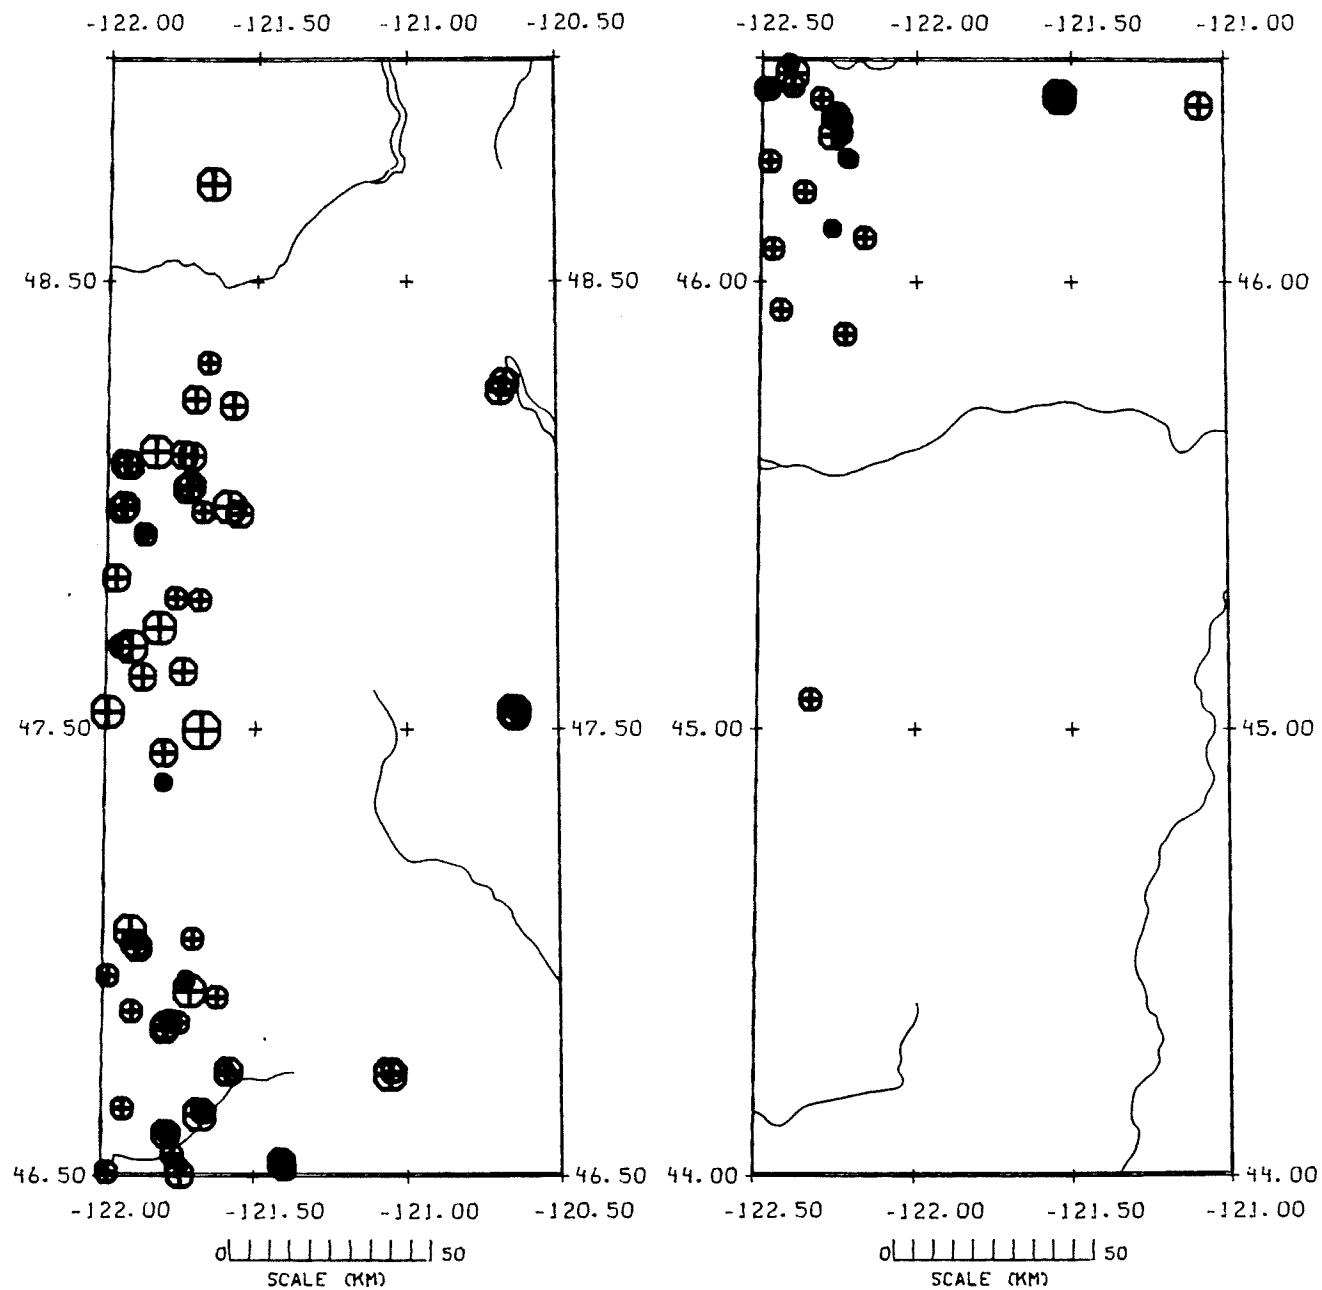

Figure 1. Earthquakes in northern and southern Cascades excluding Mt. St. Helens area, July 1 through September 30, 1983

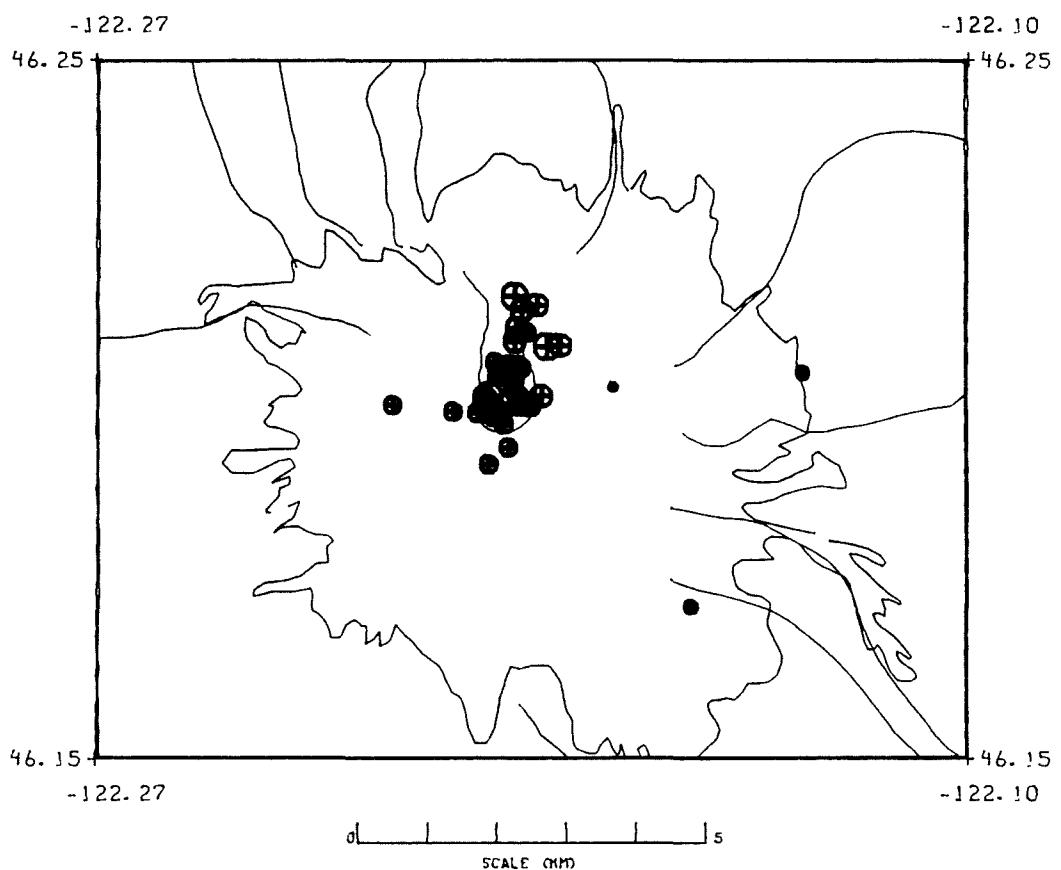

Figure 2. Earthquakes in Mt. St. Helens area, July 1 through September 30, 1983
